

## Touch Page – Documentation

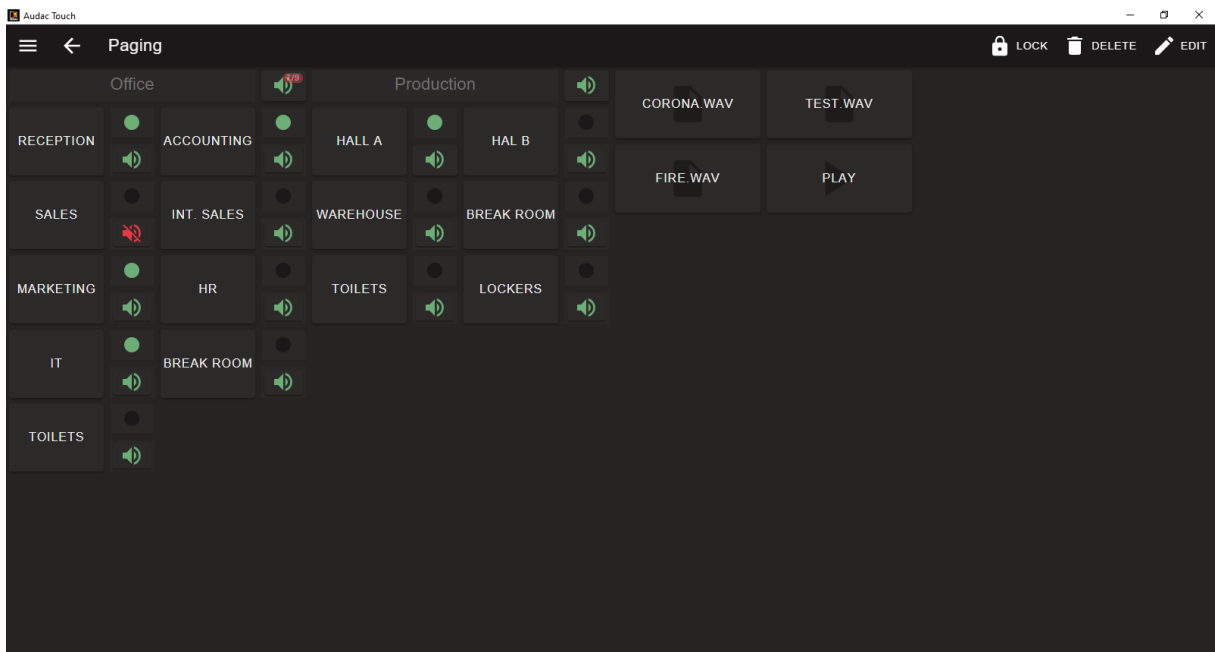

Thanks to the virtual paging feature of AUDAC Touch™ 2+, you can now control paging messages to your audience directly from the app. This exclusive feature allows you to do zone selection, triggering as well as choosing voice files directly from the app. At the basis still is an APM digital paging microphone, which is then additionally used for the spoken live messages.

In AUDAC Touch™, you can create the different zones you want to control with virtual paging. These zones can be additionally equipped with a 'Signal indicator widget' and a 'Mute button widget'. From the app, you choose the specific zones you want to control with a public address message.

When you have selected your zones, you can choose the right message and play it. If it is a live voice message, you can select the zones and broadcast the message using the APM microphone.

Touch page is the first premium feature that we will offer in the future under the name AUDAC Touch 2+. Through one-off licenses, you will be able to offer the Touch 2+ to your customers. For now, you can ask your sales person to add Touch page to your own account for testing purposes only. Afterwards we will officially launch it in the form of a free-trial that will become paying after a while.

Feedback during testing can be sent to [support@pvs.global](mailto:support@pvs.global) after which our software team will start working on it.

Keep in mind:

- This functionality is currently only compatible with the M2 but will be rolled out in future new devices.
- An APM microphone is always additionally required to use this Touch 2+ add-on.
